1 Components of the kit

Before assembling the additional device, check if the supplied kit H667 590074 is complete.

2 Operation of the device

The additional device can be used in all machines of the H-type series (967 and 969) to prevent the needle thread reel from unwinding in an irregular manner during sewing and while the thread is being forcefully advanced during cutting.

The needle thread is unwound from the bobbin (1) and guided to the sewing mechanism of the machine through the upper slot of the holder (2) via the roller (5), through the lower slot of the holder (3) and via the pre-tensioner (6).

The roller (5) oscillates on the lever (4) and is returned to its initial position by the spring (7). While the thread is advanced with great force, the roller (5) is turned, loosening the thread. The spring (7) will then return the roller (5) to its initial position, while the thread is slowly unwound from the bobbin.

Fig. 1: Description of the device

(1) - Bobbin  
(2) - Upper slot of the holder  
(3) - Lower slot of the holder  
(4) - Lever  
(5) - Roller  
(6) - Pre-tensioner  
(7) - Spring
3 Assembling, threading and setting up

**WARNING**

The kit may only be assembled by a qualified specialist so as to avoid disturbances at the entire device.

Turn off the main switch before assembling the machine.

3.1 Assembling

*Fig. 2: Assembling the device*

1. Loosen the existing screws (2) on the arm cover (3).
2. Position the device (1) as shown in the figure.
3. Re-tighten the screws (2).
4. Loosen screws (5) and (6).
5. Move the thread reel holder arm (7) to the position shown.
6. Re-tighten screws (5) and (6).

**Important**

The thread reel holder must be tilted towards the rear by approx. 10° to prevent the bobbin (4) from tipping and to ensure that it is slowed down by the friction generated between the side wall of the bobbin and the thread reel holder arm (7).

7. Loosen the nut (9), move the tube (8) to the position shown, and tighten the nut (9).
8. Remove the foam pad from the tube (8) to keep the friction between the bobbin (4) and the thread reel holder arm (7) from becoming too great.
**Important**
Caution! If the foam pad is not removed, the device cannot be set up for proper functionality.

### 3.2 Threading of the needle thread

*Fig. 4: Threading of the needle thread*

1. Thread the needle thread at the top as shown in the figure.

**Information**
The roller is fitted with a slot into which the thread is inserted during threading, making it easier to wrap the thread around the roller.

*Fig. 5: Detailed view of roller with slot, p. 8.*
Fig. 5: Detailed view of roller with slot
3.3 Setting

Fig. 6: Setting

1. Thread the needle thread into the device, sew with a larger stitch length and press the thread cutter.

2. If the roller (1) remains at its initial position (i.e. is not moving) when the thread tightening process is interrupted, check if the thread reel holder arm (4) is tilted towards the rear by approx. 10° and if the bobbin is slowed down sufficiently. If this is the case, reduce the pretension of the spring (3) by turning the adjustment screw (2) counterclockwise (it must rotate against the shaft onto which it has been slipped).

3. Check for proper functionality and make corrections if necessary.
4. If the roller (1) rotates during the thread tightening process and does not return to its initial position, the pretension of the spring (3) is too low. Increase by turning the adjustment screw (2) on the shaft clockwise.

5. Check for proper functionality and make corrections if necessary.
